

CLAIMS

1. A method for refreshing data in an application, comprising the steps of :
 - providing a dynamical data exchange server;
 - 5 - receiving fresh data in the server;
 - indicating to the server the nature of data requested by the application;
 - creating or modifying at least a dynamical data exchange channel between the server and the application according to the nature of data indicated;
 - pushing fresh data towards the application on the dynamical data exchange channel.
- 10 2. The method of claim 1, wherein the step of indicating is carried out by a process invoked by the application.
3. The method of claim 1, wherein the step of creating or modifying is carried out whenever nature of data is indicated to the server.
4. The method of claim 2, wherein the step of creating or modifying is carried out

15 whenever nature of data is indicated to the server.
5. The method of claim 1, further comprising the step of providing a second process, said second process being invoked for creating or modifying said at least one dynamical data exchange channel.
6. The method of claim 5, wherein the second process processes a vocable of the

20 dynamical data exchange channel.
7. The method of claim 1, wherein the dynamical data exchange server comprises an input section for receiving fresh data, an output section from which data is pushed toward the application, the method further comprising the step of copying data from the input section to the output section.
- 25 8. The method of claim 7, wherein the step of indicating further comprises indicating a refresh status for the data requested by the application, and wherein the step of copying is carried out for the data requested by the application according to the refresh status.
